

# Magnetic Mirror

Magnetic Mirror is the effect template that considers the laziest filters with a wobbly audio clip.

---

## Instructions

### Step 1

- In Audacity, import your audio file and apply the Full Bucket Frequency Shifter plugin with the preset "Up, Up, and Awoop", then export it into an existing file and put it on the Kdenlive project.

### Step 2

- In Kdenlive, import your video file as you want. But first, apply the filter Kirsch and put the scale value into 3.

### Step 3

- Apply the mirror effect within the default horizontal direction by checking invert.

## Step 4

- The last thing is that you put the chroma shift into the video and set the number of Chroma-blue V shift 255.

## Bugs & Fixes

- If the video goes much darker, move the mirror effect up after you do the chroma shift that controls itself (although it works when moving the mirror effect up before the chroma shift when picking the video that controls it more accurate).
